- CHARLSON
- E-PROGNOSIS
- SOCIAL EVALUATION

- **ROBUST:** *The patient does not show frailty or comorbidities and has an acceptable vital prognosis and we consider that can benefit from complete treatment of his oncological pathology.*
- **FRAIL:** *The patient shows frailty, but has functional and biological reserve to benefit from an active cancer treatment. Although well-adapted for their circumstances with fewer side effects than the complete treatment.*
- **POOR PROGNOSIS:** *The patient shows comorbidities and dependence that limits his life expectancy, so we recommend a conservative treatment of his oncological pathology, prioritizing palliative care.*
